## Ecological Site Description

**Site Type:** Rangeland

**Site Name:** Claypan

**Site ID:** R060AY013SD

**Major Land Resource Area:** 60A – Pierre Shale Plains

### Physiographic Features

This site occurs on nearly level or gently sloping uplands.

**Landform:** flat, plain, terrace, depression

**Aspect:** N/A

	<u>Minimum</u>	<u>Maximum</u>
<b>Elevation (feet):</b>	2500	4300
<b>Slope (percent):</b>	0	9
<b>Water Table Depth (inches):</b>	48	80
<b>Flooding:</b>		
<b>Frequency:</b>	None	None
<b>Duration:</b>	None	None
<b>Ponding:</b>		
<b>Depth (inches):</b>	None	None
<b>Frequency:</b>	None	None
<b>Duration:</b>	None	None
<b>Runoff Class:</b>	Negligible	Very high

### Climatic Features

The climate in this MLRA is typical of the drier portions of the Northern Great Plains where sagebrush steppes to the west yield to grassland steppes to the east. Annual precipitation ranges from 13 to 18 inches per year, with most occurring during the growing season. Temperatures show a wide range between summer and winter and between daily maximums and minimums, due to the high elevation and dry air, which permits rapid incoming and outgoing radiation. Cold air outbreaks from Canada in winter move rapidly from northwest to southeast and account for extreme minimum temperatures. Chinook winds may occur in winter and bring rapid rises in temperature. Extreme storms may occur during the winter, but most severely affect ranch operations during late winter and spring. The normal average annual temperature is about 46° F. January is the coldest month with average temperatures ranging from about 19° F (Moorcroft CAA, WY) to about 22° F (Belle Fourche, SD). July is the warmest month with temperatures averaging from about 70° F (Moorcroft CAA, WY) to about 72° F (Belle Fourche, SD). The range of normal average monthly temperatures between the coldest and warmest months is about 51° F. Hourly winds are estimated to average about 11 miles per hour annually, ranging from about 13 miles per hour during the spring to about 10 miles per hour during the summer. Daytime winds are generally stronger than nighttime and occasional strong storms may bring brief periods of high winds with gusts to more than 50 miles per hour.

## RANGELAND INTERPRETATIONS

### Page 2

Growth of cool season plants begins in early to mid March, slowing or ceasing in late June. Warm season plants begin growth about mid May and can continue to early or mid September. Green up of cool season plants may occur in September and October when adequate soil moisture is present.

	<u>Minimum</u>	<u>Maximum</u>
<b>Frost-free period (days):</b>	122	129
<b>Freeze-free period (days):</b>	145	152
<b>Mean Annual Precipitation (inches):</b>	13	18

#### Average Monthly Precipitation (inches) and Temperature (°F):

	Precip. Min.	Precip. Max	Temp. Min.	Temp. Max.
January	0.32	0.43	7.1	34.1
February	0.44	0.57	12.6	40.1
March	0.65	0.94	19.7	46.5

## Influencing Water Features

No significant water features influence this site.

## Representative Soil Features

The loam to silt loam surface textures of this site change abruptly at about 5 to 15 inches below the surface, to an extremely hard clayey Btn horizon having round-topped or "bun shaped" columnar or prismatic structure. These subsoils are high in sodium. Saturated hydraulic conductivity is very slow, available water capacity is low and permeability is slow to very slow. Slopes range from 0 to 9 percent. The soils on this site are deep, somewhat poorly to well drained and were formed in residuum from siltstone, shale or in silty and clayey alluvium. The surface layer is 5 to 15 inches thick. The texture of the subsoil ranges from loam to clay. The soils have a slow to very slow infiltration rate. This site should show slight to no evidence of rills or wind scoured areas. Water flow paths are broken, irregular in appearance or discontinuous with numerous debris dams or vegetative barriers.

These soils are mainly susceptible to water erosion. More information can be found in the various soil survey reports. Contact the local USDA Service Center for soil survey reports that include more detail specific to your location.

**Parent Material Kind:** alluvium  
**Parent Material Origin:** siltstone or shale, unspecified  
**Surface Texture:** silt loam, loam and fine sandy loam  
**Surface Texture Modifier:** none  
**Subsurface Texture Group:** clayey  
**Surface Fragments  $\leq 3''$  (% Cover):** 0  
**Surface Fragments  $> 3''$  (%Cover):** 0  
**Subsurface Fragments  $\leq 3''$  (% Volume):** 5  
**Subsurface Fragments  $> 3''$  (% Volume):** 0

## Plant Communities

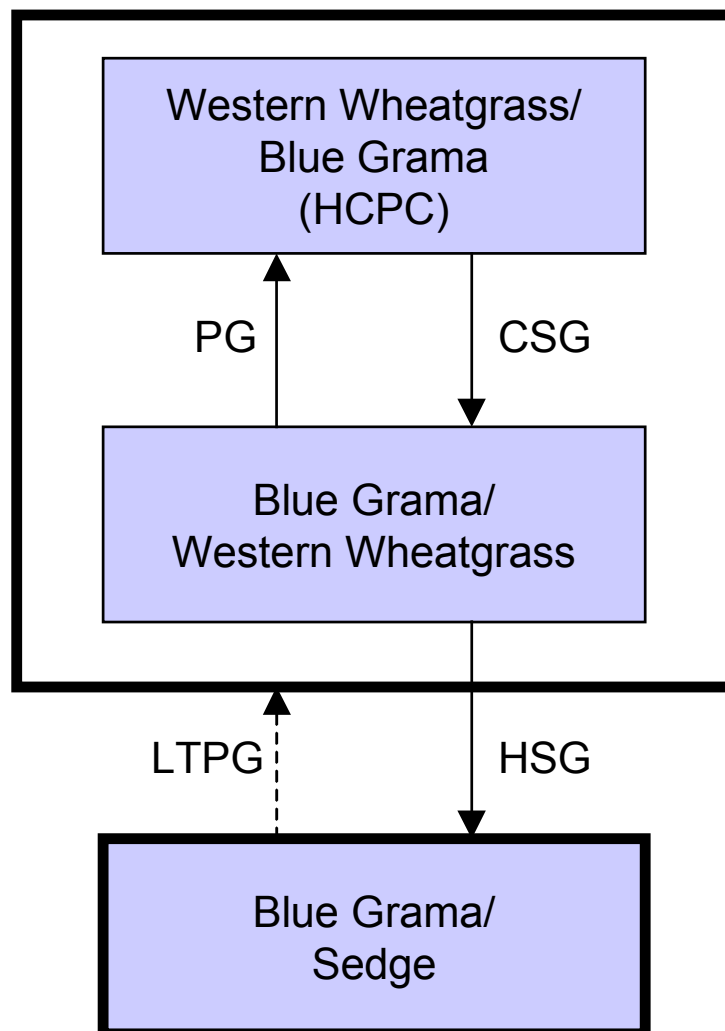

### Ecological Dynamics of the Site:

This site developed under Northern Great Plains climatic conditions, natural influences of large herbivores, occasional fire, and other biotic and abiotic factors that typically influence soil/site development. Changes will occur in the plant communities due to short-term weather variations, impacts of native and/or exotic plant and animal species, and management actions. While the following plant community descriptions describe more typical transitions between communities that will occur, severe disturbances, such as periods of well-below average precipitation, can cause significant shifts in plant communities and/or species composition.

The plant community upon which interpretations are primarily based is the Historic Climax Plant Community (HCPC). The HCPC has been determined by studying rangeland relic areas, areas protected from excessive disturbance, and areas under long-term rotational grazing regimes. Trends in plant community dynamics ranging from heavily grazed to lightly grazed areas, seasonal use pastures, and historical accounts also have been used. Plant communities, states, transitional pathways, and thresholds have been determined through similar studies and experience.

The following diagram illustrates the common plant communities and vegetation states commonly occurring on the site and the transition pathways between communities and states. The ecological processes are discussed in more detail in the plant community descriptions following the diagram.

## Plant Communities and Transitional Pathways

**CSG** - continuous seasonal grazing; **HCPC** - Historic Climax Plant Community; **HSG** - heavy seasonal grazing; **LTPG** - long-term prescribed grazing; **PG** - prescribed grazing.

## Plant Community and Vegetation State Narratives

Following are the narratives for each of the described plant communities. These plant communities may not represent every possibility, but they are the most prevalent and repeatable plant communities. The plant composition tables shown above have been developed from the best available knowledge at the time of this revision. As more information is collected, some of these plant community descriptions may be revised or removed, and new ones added. None of these plant communities should necessarily be thought of as "Desired Plant Communities". According to the USDA NRCS National Range and Pasture Handbook, Desired Plant Communities (DPC's) will be determined by the decision makers and will meet minimum quality criteria established by the NRCS. The main purpose for including any description of a plant community here is to capture the current knowledge and experience at the time of this revision.

### Western Wheatgrass/Blue Grama Plant Community

The plant community upon which interpretations are primarily based is the Western Wheatgrass/Blue Grama Plant Community. This is also considered to be the Historic Climax Plant Community (HCPC). This plant community can be found on areas that are properly managed with prescribed grazing that allows for proper utilization, changes in season of use and adequate recovery periods following each grazing event.

The potential vegetation is about 85-95% grasses or grass-like plants, 5-10% forbs and 1-5% shrubs. Cool-season grasses dominate the site, but warm-season short grasses are also prevalent. Western wheatgrass is the dominant grass. Other grasses and grass-like plants occurring include blue grama, needleandthread, prairie sandreed, little bluestem and green needlegrass. Significant forbs include silverleaf scurfpea, biscuitroot, wild parsley, cudweed sagewort and heath aster. Silver and/or big sagebrush are the principal shrubs. Other shrubs include fringed sagewort, rubber rabbitbrush and cactus.

This plant community is well adapted to the Northern Great Plains climatic conditions. Individual species can vary greatly in production depending on growing conditions (timing and amount of precipitation and temperature). Community dynamics, nutrient cycle, water cycle and energy flow are functioning properly. Plant litter is properly distributed with very little movement off-site and natural plant mortality is low. The diversity in plant species allows for high drought tolerance. Good vegetative cover coupled with moderate available water capacity can provide a favorable soil-water-plant relationship.

The following growth curve is an estimate of the monthly percentages of total annual growth of the dominant species expected during an average year:

Growth curve number: SD6002

Growth curve name: Pierre Shale Plains, cool-season dominant, warm-season sub-dominant.

Growth curve description: Cool-season dominant, warm-season sub-dominant.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	3	10	23	34	15	6	5	4	0	0

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Continuous seasonal grazing (annual, early spring) will convert the plant community to the *Blue Grama/Western Wheatgrass Plant Community*.

### Blue Grama/Western Wheatgrass Plant Community

This plant community develops under continuous seasonal grazing (i.e., grazing an area during the same season every year) or from over utilization during extended drought periods. The potential vegetation is about 75-90% grasses or grass-like plants, 5-10% forbs and 5-15% shrubs. A fairly even mix of cool-season grasses and short warm-season grasses dominates this plant community.

Blue grama and western wheatgrass are the dominant grasses. Other grasses and grass-like plants occurring include needleandthread, buffalograss, prairie junegrass, threadleaf sedge, dropseed, Sandberg bluegrass and inland saltgrass. Significant forbs include silverleaf scurfpea, cudweed sagewort, western yarrow and heath aster. Silver and/or big sagebrush are the principal shrubs, and increase slightly when compared to the HCPC. Other shrubs include fringed sagewort, rubber rabbitbrush, broom snakeweed and cactus. This plant community is somewhat resistant to change. The dominant herbaceous species are very adapted to grazing; however, the mid-grass species and the more palatable forbs will decrease in the community through continuous seasonal grazing. If the herbaceous component is intact, it tends to be resilient if disturbance is not long-term. Because of the sod forming habit of the shortgrass species, water infiltration decreases and runoff increases when compared to the HCPC.

The following growth curve is an estimate of the monthly percentages of total annual growth of the dominant species expected during an average year:

Growth curve number: SD6003

Growth curve name: Pierre Shale Plains, cool-season/warm-season co-dominant.

Growth curve description: Cool-season, warm-season co-dominant.

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Heavy continuous grazing will convert this plant community to the *Blue Grama/Sedge Plant Community*.
- Prescribed grazing will shift this plant community back to the *Western Wheatgrass/Blue Grama Plant Community (HCPC)*.

### Blue Grama/Sedge Plant Community

This plant community results from heavy continuous grazing and/or annual, early spring seasonal grazing. Short grasses and forbs increase to dominate the plant community and annual production decreases dramatically. Lack of litter and short plant heights result in high soil temperatures, high soil water loss and poor water infiltration rates, which gives blue grama a competitive advantage over cool season mid-grasses. This plant community can occur throughout the pasture, on spot grazed areas, and around water sources where season-long grazing patterns occur. Blue grama and sedge are the prominent species with the balance being lesser amounts of buffalograss, inland saltgrass, prairie junegrass, western wheatgrass and needleandthread. Forbs and shrubs such as fringed sagewort, cudweed sagewort, heath aster, broom snakeweed, cactus and western yarrow may also be present. This plant community is relatively stable. The thick sod and competitive advantage prevents other species from establishing. This plant community is less productive than the HCPC. Runoff increases and infiltration will decrease. Soil erosion will be minimal due to the sod forming habit of blue grama and buffalograss.

The following growth curve is an estimate of the monthly percentages of total annual growth of the dominant species expected during an average year:

Growth curve number: SD6003

Growth curve name: Pierre Shale Plains, cool-season/warm-season co-dominant.

Growth curve description: Cool-season, warm-season co-dominant.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	3	10	20	28	21	10	5	3	0	0

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Long-term prescribed grazing that includes changing season of use and allowing adequate recovery periods to enhance cool season grasses can slowly shift this plant community back towards the *Blue Grama/Western Wheatgrass Plant Community*.

## Animal Community – Grazing Interpretations

The following table lists annual, suggested initial stocking rates with average growing conditions. These are conservative estimates that should be used only as guidelines in the initial stages of conservation planning. Often, the current plant composition does not entirely match any particular plant community (as described in this ecological site description). Because of this a resource inventory is necessary to document plant composition and production. More accurate carrying capacity estimates should eventually be calculated using the following stocking rate information along with animal preference data and actual stocking records, particularly when grazers other than cattle are involved. With consultation of the land manager, more intensive grazing management may result in improved harvest efficiencies and increased carrying capacity.

Plant Community	Average Annual Production (lbs./acre, air-dry)	Stocking Rate* (AUM/acre)
Western Wheatgrass/Blue Grama (HCPC)	1400	0.40 – 0.50
Blue Grama/Western Wheatgrass	1000	0.25 – 0.35
Blue Grama/Sedge	650	0.15 – 0.25

\* Based on 790 lbs./acre (air-dry weight) per Animal Unit Month (AUM), and on 25% harvest efficiency (refer to USDA NRCS, National Range and Pasture Handbook).

Grazing by domestic livestock is one of the major income-producing industries in the area. Rangeland in this area may provide yearlong forage. During the dormant period, the forage for livestock will likely be lacking protein to meet livestock requirements, and added protein will allow ruminants to better utilize the energy stored in grazed plant materials. A forage quality test (either directly or through fecal sampling) should be used to determine the level of supplementation needed.

## Hydrology Functions

Water is the principal factor limiting herbage production on this site. Soils on this site are in Hydrologic Soil Groups C and D. Infiltration and runoff potential for this site varies from moderate to high depending on soil hydrologic group, slope and ground cover. In many cases, areas with greater than 75% ground cover have the greatest potential for higher infiltration and lower runoff. An exception would be where short grasses form a dense sod and dominate the site. Normally areas where ground cover is less than 50% have the greatest potential to have reduced infiltration and higher runoff (refer to Section 4, NRCS National Engineering Handbook for runoff quantities and hydrologic curves).

## Recreational Uses

This site provides hunting opportunities for upland game species. The wide variety of plants which bloom from spring until fall have an esthetic value that appeals to many visitors.

## Wood Products

## Other Products

Seed harvest of native plant species can provide additional income on this site.
